Huyghe BG,

```
The invention relates to peptidomimetic compounds (AAY77415-Y77438)

Capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC CA940(7029) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the maturation and trafficking. VLA-4-mediated

CC important role in the maturation and trafficking. VLA-4-mediated

CC important role in the maturation and trafficking. VLA-4-mediated

CC critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory condition, who as as as a stanka, theumatory act to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, ciabetes, inflammatory bowel disease, kidney inflammation and createnosis, prior art inhibition of VLA-4(CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immunoir response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in CC comparison to the CS-1 peptide and therefore lass expensive to comparison to the CS-1 peptide and therefore lass expensive to comparison to the CS-1 peptide to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide for invary 1 to make and is subject to rapid proteolytic comparison to the CS-1 peptide for invary 1 to make and is subject to rapid proteolytic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LDV peptide; VLA-4 inhibitor; very late antigen; alpha-4-beta-1; CD49d/CD29; cell adhesion; arylalkyl azolylalkanoic acid derivative; arylureidoalkyl azolylalkanoic acid derivative; inflammatory disorder; autoimmune disorder; respiratory disorder; LDV motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 23; DB 21; Length 5; 100.0%; Pred. The invention relates to a method for treating a mammal with, or at risk of developing, chronic renal failure, involving the administration of at least one integrin antagonist. The integrin antagonists that may be used in the method include antagonists of alpha-1-subunit containing integrins or antagonists of alpha-1-subunit containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antigen.) alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and tis cognate ligand (collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic collagens of your pretrensive glomerulosclarosis, chronic glomerulomphitis, hereditary nephritis or renal dysplasia. Sequences AAB73464-AAB73466 represent fibronectin, which inhibit fibronectin-dependent call adhesion, and may therefore be used in the method of the invention.
                                                                                                                                                                                                                                 Treating a mammal in, or at a risk of developing, chronic renal failure, involves administering at least one integrin antagonist to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanoic acid derivatives and related compounds (1), and their scalylalkanoic acid derivatives and related compounds (1), and their salely for salts and prodrugs. These are are integrin inhibitors, specificially of VLA-4 (very late antigen 4, also known as alpha 4-beta-1 or CD494/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-finducible cell surface protein VCAM-1 (vascular cell adhesion molecule-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and disease. Sequences AAVS048-VS050 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Integrin antagonist, VLA-4 antagonist, alpha-4-beta-1 integrin, very late antigen; antibody, kidney disease; chronic renal failure, end-stage renal disease; chronic diabetic nephropathy; diabetic glomerulopathy; diabetic renal hypertrophy; hypertensive nephrosclerosis; hypertensive glomerulosclerosis; chronic glomerulonephritis; hareditary nephritis; renal dysplasia; nephrotropic; cell adhesion inhibition; fibronectin CS-1 region.

                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide components to form a peptidase stabilised therapeutic peptide components to form a city are useful for modifying therapeutic peptides of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of 3-50 aminos, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases in the action of AMB02441 represent peptides which can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                   Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bolypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats

The present sequence is given in a specification relating to a polypeptide comprising a series of heptad-repeats that mimic a transmembrane domain, and a selected cytoplasmic domain attached to the putpad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amino acid sequence to other heptad repeats in the series. The collypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for and for identifying agents as inhibitors of alpha4 integrin biological responses by contacting the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin blocking immune responses in conditions such as inflammatory bowel disease, arthritis, multiple sclerosis and asthma and in inhibiting atherosclerosis and scarring during wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN/VLA-4 interaction plays and runcortion may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, cliabetes, inflammatory bowel disease, kidney inflammation and
                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders
The present invention relates to a peptide with a series of heptad-repeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad respeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation,
                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chen PG;

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4 mediated important role in the maturation and trafficking. VLA-4 mediated control important role in the maturation and reafficking. VLA-4 mediated control important role in the inflammatory response. The peptidomimetics of the critical step in the inflammatory response. The peptidomimetics of the critical step in the inflammatory response. The peptidomimetics of the conditions, such as sathma, rheumatoria arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriants and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restences of view of the central nervous contaction and restences.
                                                                                                                                                                                                                                                                                                                          ö
restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders

involves the use of anti-VLA-4 antibodies, which can themselves induce ar immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to and AX777434 *Y77444 represent fragments of the CS-1 peptide tested for the comparison to the CS-1 peptide and therefore less expensive to the Late and AX777434 *Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an alpha4 integrins targeting sequence, which is used in an example from the present invention. The present invention describes a chimeric adenovirus fibre protein (AFP) containing a constrained non-native amino acid sequence. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene therapy, for treating cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. oystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, tuberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.

                                                                                                                                                                                                                                                                                                                                                                                               The peptide is derived the CS-1 peptide (Humphries et al., 1987, J. Biol. Chem. 262:6886-6892), from the IIICS variable region of information. The peptide inhibits binding of lymphocytes to endothelial cells preventing migration through the vascular endothelium and into tissues. It acts by blocking the alphatbetal extracellular matrix receptor. Admin. of the peptide can betal extracellular matrix receptor. Admin. of the peptide can chronic or relapsing activation of the immune system, including collagen vascular diseases and other autoimmune diseases.
                                                                                                                                                                                                                                                                                                                          Inhibition of lymphocyte adherence to vascular endothelium - using a novel antibody or peptide for treatment of auto-immune disease, asthma, allergy etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to new propenamide compounds of formula RIR2C=C(R3)CO-(NH)x-A and their (optionally crosslinked) polymers, where R1 and R2 are H or COOH, R3 = H, Me, Et, halo or carboxymethyl, A is a peptide of formula -(R4)x-(CO)x-(G1U)x-(IL8)x-Leu-App-Val-(Pro)x-(Ser)x-(Thr)Xin-(Z)x-(R5)x-, where Z = 0 or NH, one of R4 and R5 is a terminal H and the other is absent or 1-11C alkylene or 6-11C arylene each of which may be optionally substituted, n = 1 - 5, and x = 0 or 1. The compounds and their polymers combine with cell surface receptors and prevent cell adhesion. They can be used to inhibit cancer metastasis and to activate lymphocytes, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAW25187-W25192 are peptides containing an LDV sequence or equivalent. The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid acide). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.
                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               introducing genetic material, proteins, peptides and immunoglobulins into living cells. In particular, they can be used in gene therapy for the treatment of disorders such as thalassemia and cancer.

                                                                                                                                                                                                                            AAR92536-R92555 represents VLA-4 binding peptides derived from the antibody 21/6. VLA-4 is also known as alpha4betal integrin and cantibody 21/6. VLA-4 binds to the non-matrix molecule VCAM-1, which is expressed by endothalial and other cells. These sequences mimic a short consensus sequence in the heavy chain complementarity determining region (CDR) 3 of monoclonal antibodies against alpha4betal integrin. These sequences inhibit the adhesion of leucocytes mediated by VLA-4. It is useful for treating inflammatory brain disorders (especially multiple sederosis), meningitis, encephalitis, asthma, Alzheimer's disease, theumatord arthritis, transplant rejection, tumour metastases and myocardial ischaemia. These sequences can also be labelled, and can then the used for in vivo or in vitro diagnosis, such as monitoring confidential metastases, inflammatory responses, isolating leucocytes, in assays for inhibitors of inflammatory responses, isolating leucocytes, in assays for inhibitors of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                 New peptide(s) that bind VLA-4, inhibit leucocyte adhesion - useful esp. for treatment of inflammatory disease, e.g. multiple sclerosis

This sequence represents a fibronectin protein fragment used in the extracellular matrix (A) of the invention. (A) is used for promoting wound healing, and comprises a recombinant fibronectin peptide, containing peptide fragments from at least two fibronectin domains, and a backbone matrix. The fibronectin domain peptides used are preferably from the IIICS domain. The cell binding domain, or the heparin II binding domain, or the heparin II binding domain of human fibronectin. (A) provides haemostasis and an environment that recruits new tissue cells to the site of the wound. (A) is used to promote healing of acute or chronic wounds, e.g. surgical incisional promise, traumatic wounds, radiation wounds, cancer extirpations, venous leg ulcers, diabetic ulcers and pressure ulcers.
          Fibronectin, extracellular matrix; wound healing promoter; IIICS domain; cell binding domain; heparin II binding domain; haemostasis; therapy; surgical incisional wound; traumatic wound; radiation wound; cancer extirpation; venous leg ulcer; diabetic ulcer; pressure ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fibronectin; extracellular matrix. open wound healing; IIICS domain; acute gaping cutaneous wound; chronic cutaneous ulcer; therapy; wound healing promoter; cell binding domain; heparin II binding domain.
                                                                                                                                                                                                                                                                                                                                                          Extracellular matrix for promoting wound healing containing recombinant fibronectin-derived peptide and backbone matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 23; DB 20; Length 8; ilarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a specifically claimed non-native amino acid sequence from a chimeric adenovirus fibre protein (AFP) of the present invention. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene efficiently bind to and enter cells. The products can be used for gene well as genetic disorders, e.g. metanonma, glioma and lung cancers as well as genetic disorders, e.g. cystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, tuberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrocitic tissue, and in autolimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                                                                                                        Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                               Chimeric adenovirus fiber protein non-native amino acid sequence 56

                                                                                                                                                This sequence represents a fibronectin protein fragment used in the extracellular matrix of the invention. The extracellular matrix comprises two or more fibronectin domains in a backbone matrix, and is used to enhance wound healing. The fibronectin domain peptides used are preferably from the IIICS domain, the cell binding domain, or the heparin II binding domain of human fibronectin. The matrix facilitates wound healing by providing an environment that intrinsically recruits new tissue cells to the wound site. The new matrix is useful for facilitating wound healing, especially useful for treating open wounds such as acute gaping cutaneous wounds and chronic cutaneous ulcers. The problem of chronic, non-healing wounds is severe. These open wounds require long-term care and procedures that are costly and labour intensive.

The prior compositions and matrices have not been useful or cost effective. The present invention provides a matrix for wound healing that meets these requirements, and overcomes the deficiencies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

therapy, comprising a nucleic acid encoding a therapeutic gene and a promoter, a transfection vehicle and an agent to disrupt the function of the junctional complex in the cells. The pharmaceutical composition has cytostatic, cardiant, vasotropic, antinflammacory and antilipaemic activity. The pharmaceutical composition is useful for gene therapy and for enhancing efficiency of gene delivery to cells. The composition is useful for gene therapy of experic fibrosis, inflammatory or fibrotic lung diseases, peripheral vascular disease, coronary arterial diseases, restenosis, hypercholesterolaemia and cancer. The present sequence represents a vitronectin peptide. The peptide can be used to enhance the binding affinity of a viral vector used in the pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       System for reconstructing osseous tissue, useful e.g. for treating fractures, comprises scaffold containing promoter of bone formation and

The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanoic acid derivatives and related compounds (I), and their salts and prodrugs. These are are integrin inhibitors, specifically of VLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD494(CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-inducible cell surface protein VCA-1 (vescular cell adhesion molecule-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion,
                                                                                                                                                                                                                                                                                           AAY69618 standard; peptide; 8 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                               bone formation and a component that decreases bone resorption [11].

(II) induces migration and adhesion of osteoblasts and osteoclasts and control of induces migration and adhesion of osteoblasts and osteoclasts and rearrix. (I) is preferably selected from: selectin or selectin binding fragments, proteins and peptides that facilitate cell adhesion, companinogen activator inhibitors, protease inhibitors and metalloprocease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the scaffold can extenderemining step of extracellular matrix formation. The scaffold can be designed to have a predetermined resorbiton/degradation rate, and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for treating a mammal with, or at risk of developing, chronic renal failure, involving the administration of at least one integrin antagonist. The integrin antagonists that may be used in the method include antagonists of alpha-4-subunit containing integrins or antagonists of alpha-1-subunit-containing integrins. In particular, the antagonists as antibodies specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic
and consequent or associated pathogenic processes mediated by VLA-4, and way therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders . These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and inflammatory bowel disease. Sequences ANY69618-Y69520 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating a mammal in, or at a risk of developing, chronic renal failure, involves administering at least one integrin antagonist to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2XXX2X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of the perfect than from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular upcake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the
                                                                                                                                                        ö
glomerulopathy, diabetic renal hypertrophy, hypertensive nephrosclerosis, hypertensive glomerulosclerosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAB73464-AAB73466 represent peptides derived from the VLA-4 binding domain (CS-1 region) of fibronectin, which inhibit fibronectin-dependent cell adhesion, and may therefore be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity

These PEG derivates or their salts are useful as animal cell adhesion inhibitors, or as platelet agglutination or adhesion inhibitors. They may also be used as carcinoma metastasis inhibitors, wound healing drugs and immunoregulators.

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (55 amino acida) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an leukocyte adhesion to the CS-1 FN/VLA-4 interaction plays an elukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis is osteoarthritis and allograft rejection. They may also be used to treat poorianis and other skin inflammations, demyelinating diseases of the central nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fibronectin, FN; CS-1; endothelial cell, VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders
                                                                                                         The sequences given in AAR28885-86 are peptides which have been shown to inhibit cell adhesion. These peptides can be used as the active component in a cancer metaeris inhibitor, a wound healer, an immunosuppressant, a platelet aggregation inhibitor or a neuropathy
                                      Peptide deriv. - useful as cancer metastasis inhibitor, wound healer, immunosuppressant, etc.
                                                                                                                                                                                                                   100.0%; Score 23; DB 13;

(e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4CS-1 interaction either involves the use of anti-VTA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidemineties of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to anniantacture, and are resistent to proteolysis. Sequences AA777411-Y77414 and AA777434-Y77444 represent fragments of the CS-1 peptide for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, D494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes, the CS-1 FN/VLA-4 interaction plays an lemportant role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as astbma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyeliating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD94/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein (ibronectin (FN). VLA-4 is expressed on the surface of leukcoytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4 mediated elukcoyte adhesion to the CS-1 FN/VLA-4 interaction plays an elukcoyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the cinvention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other expression and inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, cliabetes, inflammatory bowel disease, kidney inflammation and
diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteclytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteclysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.

The invention relates to peptidomimetic compounds (AAY77415-Y77438)
capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD940/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammacory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAX77411-Y77414 and AAX77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistent to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a 2,4,6-trisubstituted s-triazine ring, where one substitution is a polyethylene glycol chain [CH3 (CH2CH2)] no-6 - no-1-50)] and the cher is either another, same, polyethylene glycol chain, or another, same, peptide chain. For examples see also AAR29631-32. These PEG derivates or their salts are useful as animal cell adhesion inhibitors, or as platelet agglutination or adhesion inhibitors. They may also be used as carcinoma metastasis inhibitors, wound healing drugs and
                                                                                                                                                                                                                                      Gapa

The alpha-4 beta-1 (CD49d/CD29, VLA-4) cell adhesion receptor is an active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAW01703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds. of minimal length. A minimal essential sequence for
                                                                                                                                                                         This peptide deriv. inhibits adhesion of animal cells, partic patelet aggregation. The deriv. can be used in cancer metastasis inhibitors, wound healers, immune inhibitors, platelet aggregation inhibitors or drugs for treating neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fibronectin; high affinity, CS-1; recognition sequence; VLA-4; alpha-4 beta-1 call adhesion receptor; CD94/CD29; inhibitor; leukocyte trafficking function; peptidonimetic; treatment; asthma; rheumatoid arthritis; osteoarthritis; allograft rejection;
                                                                                           Peptide deriv., for cancer metastasis inhibitor - useful as wound healer, immune- and platelet aggregation inhibitor and neuropathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide mimics of fibronectin CS-1 sequence - inhibit interaction of endothelial cells and VLA-4 carrying inflammatory cells, for treating or preventing asthma, arthritis etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 skin inflammation; central nervous system demyelinating disease.
                                                                                                                                                                                                                                                                     100.0%; Score 23; DB 13; Length 10; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The alpha-4 beta-1 (CD49d/CD29, VLA-4) cell adhesion receptor is an active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAMO1703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds. of minimal length. A minimal essential sequence for peptidomimetic cpds. of minimal length. A minimal essential sequence for beptidomimetic peptidomimetic the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 3000-fold greater than the inhibition in the binding exhibited by AAMO1705. CS-1 mediated inflammation, e.g. asthma, rheumatoid arthritis, osteoarthritis, allograft rejection, skin
specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. The generic peptidomimetic inhibits the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 3000-fold greater than the inhibition in the binding exhibited by the present standard peptide sequence. CS-1 mediated inflammation, e.g. asthma, rheumatoid archritis, osteoarthritis, allograft rejection, skin inflammation or central nervous system demyelinating disease, can be treated by the peptidomimetics. See AAW01706-27 for exemplary inhibitor peptides.

Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA481) or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA481) or VLA-4 for very late antigan-4), a heterodimeric protein present on the surface of certain white blood cells in adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cells flooding to the scene, causing widespread tissue damage. Chods capable of blocking this process may be beneficial as therapeutic agents. IA481 also recognises the extracellular matrix glycoprocein fibronectin. Three distinct IA481-binding sites have been identified within fibronectin. One site is found in the Hepli region and is expressed in all isoforms; two others (CS1 and CS5) are present in the affinity for IA481 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1
                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VCAM-1; vascular cell adhesion molecule-1; VLA-4; very late antigen-4; inhibitor; binding; white blood cell; migration; capillary wall; tissue damage; injury; fibronectin; extracellular matrix glycoprotein; CS1; CS5; H1; LDV; active site.

The invention provides integrinting the course of the invention. The invention provides integrinting the course of the invention. The invention provides that comprise an integrint alpha or beta clain associated with an immunoglobulin light or heavy chain. These chimeric proteins form heterodimer complexes, in particular with a chimeric protein containing an integrin alpha chain of an immunoglobulin chain; the immunoglobulin chain; the integrin alpha chain is preferably alpha 4 or alpha 2 and the integrin beta chain is preferably beta 1. Animal cells transformed with vectors containing the DNA coding for the above chimeric proteins can be used in the preparation of the chimeric proteins and their perparation of the chimeric proteins and their betaching promoters and inhibitors of the binding of integrins to their poptential promoters and inhibitors of the binding of integrins to their conjugands, function as blood platelet substitutes and hemostatics and as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is used in the course of the invention. The specification describes Hepatitis drugs which contain integrin inhibitors as the active ingredient. These integrin inhibitors include antibodies, proteins, polypeptides, morelet acids, saccharides, and their derivatives. They also include low molecular weight compounds capable of binding to integrins (e.g. alpha chain type with alpha 1, particularly anti-VLA-4 antibody, VLA-4 inhibiting peptides and low molecular weight VLA-4 inhibiting compounds. The products can be used for treating hepatitis.
                                                                                                                                                                                                                                                                                                                              Hepatitis drug; integrin inhibitor; integrin binding; {\tt VLA-4}; treatment; hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Integrin inhibitors including antibodies, proteins, nucleic acids, saccharide(s), capable of binding to integrin(s) as active ingredient in remedies - for treating hepatitis, by inhibiting cell

                                                                                                                                                                                                                                                                                                        The present sequence represents part of a CS-1 peptide. The specification describes a cyclic CS-1 peptidommimencic inhibitor peptide, which is water soluble and inhibits the binding of Jurkat cells to a solid-phase bound peptide (AAW88057). The inhibitor peptides are useful for treating fibronectin CS-1 or sVCAM 1/VLA-4 mediated inflammation, esq. asthma, arthritic conditions (e.g. rheumatoid arthritis, osteoarthritis), allograft rejection, skin inflammation and demyelinating diseases of the central nervous system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fibronectin, FN, CS-1, endothelial cell, VLA-4 integrin, alpha-4-beta-1, CD49d/CD29; leukocyte, inflammatory cell, inflammation; cell adhesion, inhibitor; peptidomimetic, autoimmune disease, inflammatory disorder.

The invention relates to peptidomimetic compounds (AAY77415-Y77438)

Capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CG 6494(CD29) to the CS-1 portion (25 amino acida) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the extracellular matrix protein fibronectin (FN). VLA-4 interaction plays an critical step in the inflammatory endocthelial cells is also a critical step in the inflammatory chronic and acute immunoinflammatory conditions, such as sethma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, clabetes, inflammatory bowel disease, kidney inflammation and crescences, prior art inhibition of VLA-4/CS-1 interaction either response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteclytic degradation. The peptidomimetics of the invention are smaller in CC comparison to the CS-1 peptide and therefore less expensive to comparison to the CS-1 peptide and therefore less expensive to the CS-1 peptide and therefore less expensive to the CS-1 peptide to their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide for (AAY77414).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Virucide, human immunodeficiency virus, HIV, cytostatic, ophthalmological, vasotropic, vaccine, gene therapy, transfection, cystic fibrosis, asthma; cancer, lubacemia, glaucoma; gene vaccination, anti-sense therapy, eye disease, corneal organ transplant; integrin;
                                                                                                                                                                                                                                                                New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes transfecting (I) confluent cells or other slowly dividing or non-dividing cells that are in contact with each other, with a nucleic acid. The method comprises contacting the cells with a receptor-targeted vector comprising the nucleic acid, and an agent that transfection the section of the useful for transfecting bronchial and lung transfection. (I) is useful for transfection bronchial and lung cancers and viral infections e.g. human immunodeficiency virus (HIV) infection. Hamaropoietic cell transfection enables gene therapy, gene vaccination and anti-sense therapy of diseases involving haematopoietic cells, including leukaemia and bone marrow stem cell disorders.

Transfection of corneal endothelium is useful for treatment of eye classes affecting the corneal organ transplants, for e.g. in glaucoma. A gene preventing cell proliferation in blood vessel walls is introduced using an integrin targeting transfection vector complex (II) to reduce restenosis. (II) is useful for intracellular transport and delivery of anti-sense oligonuclede, which enables antiviral and cancer therapy and is effective in transporting large DNA molecules. This sequence represents a peptide that lacks the conserved RGD integrin binding amino acid sequence but binds integrins allowing the integrin caid to pass into the cell, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The invention relates to integrin-targetting vectors having enhanced transfection activity. The vector complex comprises a nucleic acid, an integrin binding component, a polycationic nucleic acid, binding component. The integrin binding component component and a lipid component. The integrin binding component component and a lipid component. The integrin binding component component and a lipid component. The integrin binding component component and a lipid component. The integrin binding element and a spacer element. Complex component acid, for transfecting cells in vitro or in vivo with a nucleic acid, for transfecting bronchial and lung epithelium and caused in human or a non-human animal by a defect and/or a deficiency in a gene, immunisation and antisense therapy of a human or a non-human animal. It is useful for transfections for cystic fibrosis, asthma and also various cancers and viral infections for example human components of neuroblastoma and the effective transfection of primary smooth muscle cells, cardiac myocytes and haematopoietic cells. The manatopoietic cell transfection and the effective transfection of a cytokine gene may be used for adjuvant immunotherapy. Transfection of a cytokine gene may be used for adjuvant immunotherapy. Transfection of a cytokine gene may be used for transfection of corneal and cohem marrow stem cell disorders, for example transfection of corneal and coheminal organ transplants, for example constances and antisense therapy complex of the invention to reduce the present sequence is integrin-binding peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VLA-4; inhibitor; binding peptide; leucocyte adhesion; CD49d/CD29; CDR; alpha4betal integrin; VCAM-1; endothelial cell; antibody; meningitis; complementarity determining region; inflammatory brain disorder; therapy; multiple sclerosis; encephalitis; Alzheimer's disease; atherosclerosis;

                                                                                                                                                                                                                                                                                                             ARA92534 and AAR92535 represents VLA-4 binding peptides. VLA-4 is also known as alpha4betal integrin and CD49d/CD29. VLA-4 binds to the non-matrix molecule VCAM-1, which is expressed by endothelial and other cells. This sequence (and peptides designed from it) mimic a short consensus sequence in the heavy chain complementarity determining region (CDR) 3 of monoclonal antibodies against alpha4betal integrin. This sequence inhibits the adhesion of loucocytes mediated by VLA-4. It is useful for treating inflammatory brain disorders (sepecially multiple sclerosis), meningitis, encephalitis, asthma, Alzheimer's disease, rheumatoid arthritis, transplant resjection, tumour metastrases and myocardial ischaemia. This sequence can also be labelled, and can then consensed for in vivo or in vitro diagnosis, such as monitoring inflammatory responses, isolating elecocytes, in assays for inhibitors of VLA-4/VCAM-1 interactions and imaging sites of inflammation.

This sequence is a fragment of CS-1 (AAW01703) a high affinity peptide cecognition sequence for VLA-4 within fibronectin. The alpha-4 beta-1 (CD494/CD29, VLA-4) cell adheasion receptor is an active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion of FN on their surfaces of minimal essential sequence for specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. The generic peptidomimetic inhibite the binding of Jurkat cells (ATCC TIB 152) to a solid phase-complete the binding of Jurkat cells (ATCC TIB 152) to a solid phase-complete the inhibition in the binding exhibited by AAW01705. Deletion mutants of the present sequence were formed and in vitro binding of the peptides was assayed and compared to that of the full length CS-1 mediated inflammation, e.g. asthma, rheumatoid archritis, osteoarthritis, allograff rejection, skin inflammation or central nervous system demyelinating disease, can be treated by the peptidomimetics. See AAW01706-27 for exemplary inhibitor peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide mimics of fibronectin CS-1 sequence - inhibit interaction of endothelial cells and VLA-4 carrying inflammatory cells, for treating or preventing asthma, arthritis etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 23; DB 16; Length 12; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Integrin; transfection complex; integrin-binding; lipid; immunisation; antisense therapy, enzyme; therapeutic agent; immunogen; cystic fibrosis; cancer; viral infection; human immunodeficiency virus; cardiovascular;
                                                                                                                                                                  The specification describes a cyclic CS-1 peptidomimimetic inhibitor which is water soluble and inhibits the binding of Jurkat cells to a solid-phase bound peptide (AAW88057). The inhibitor peptides are useful for treating fibronectin CS-1 or sVCAM I/VIA-4 mediated inflammation, e.g. asthma, arthritic conditions (e.g. rheumatoid arthritis, oslograft rejection, skin inflammation and demyelinating diseases of the central nervous system. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                               Cyclic inhibitor peptide - useful for treating fibronectin CS-1 or sVCAM-1/VLA-4 mediated inflammation, e.g. asthma and arthritic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New integrin-targeting transfection complex including lipid - used to improve transfection efficiency for a very wide range of cells, useful in, e.g. antisense therapy and genetic immunisation

```

The invention relates to an integrin-targeting transfection complex. The complex comprises a nucleic acid, an integrin-binding component, a

```
polycationic nucleic acid-binding component and a lipid. The complexes are used for in vivo or in vitro transfection of cells, specifically:

(1) for treatment or prevention of disease (in humans or other animals) caused by defective or deficient genes; (ii) for immunisation; (iii) for antisense therapy, and (iv) for protein production in host cells, e.g. or enzymes, therapeutic agents, vaccinating immunogens and diagnostic antisens. Typical of the diseases that can be treated or prevented are cystic fibrosis, cancer, viral infection (e.g. human immunodeficiency virus), cardiovascular disease (e.g. restenosis), leuksemia, asthma and glaucoma. Incorporation of the lipid into the complex increases transfection levels from 1-10 percent to over 50 percent. This effect is observed with all cell types tested including those that are resistant to transfection by most plasmid vectors. The complexes can carry large genes, up to 125 kb, e.g. an artificial chromosome. The present sequence represents a claimed example of an integrin-binding peptide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, P0494/CD29) to the CS-1 portion (52 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chen PG;

                                                                                                                                                                                                                                                                                                                         ö
                allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis, allergies, atherocalerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either immores the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide to immobility to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes transfecting (I) confluent cells or other slowly dividing or non-dividing cells that are in contact with each other, with a nucleic acid. The method comprises contacting the cells with a receptor-targeted vector comprising the nucleic acid, and an agent that disrupts cell-cell junctions under conditions suitable to effect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Virucide, human immunodeficiency virus, HIV; cytostatic, ophthalmological, vasotropic; vaccine; gene therapy; transfection; cystic fibrosis; asthma; cancer; leukaemia; glaucoma; gene vaccination; anti-sense therapy; eye disease; corneal organ transplant; integrin; transfection; restenosis; alpha 4 beta 1 integrin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transfecting confluent cells with nucleic acid for gene therapy or gene vaccination, comprises contacting the cells with a receptor-targeted vector having the nucleic acid and an agent that disrupts cell-cell

transfection. (I) is useful for transfecting bronchial and lung epithelium for gene therapy for cystic fibrosis, asthma and also various cancers and vizal infections e.g. human immunodeficiency virus (HIV) infections e.g. human immunodeficiency virus (HIV) infection. Haematopoietic cell transfection enables gene therapy, gene vaccination and anti-sense therapy of diseases involving haematopoietic cells, including leuksemia and bone marrow seem cell disorders.

Transfection of corneal endothelium is useful for treatment of eye disease affecting the cornea or corneal organ transplants, for e.g. in glaucoma. A gene preventing cell proliferation in blood vessel walls is introduced using an integrin targeting transfection in blood vessel and cancer therapy and is effective in transporting large DNA molecules.

This sequence represents a peptide that lacks the conserved RGD cancer therapy and is effective in transporting large DNA molecules.

This sequence represents a peptide that lacks the conserved RGD cancer therapy and of the invention.

Construction of desquence and cysteine residues for cyclisation, but can bind to integrins to allow the nucleic acid to pass into the cell,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Integrin binding component; polycationic nucleic acid-binding component; lipid component; prophylaxis; immunisation; antisense therapy; asthma; cystic fibrosis; cancer; viral infection; human immunodeficiency virus; HIV infection; vaccine; neuroblastoma; bone marrow stem cell disorder; leukaemia, adjuvant immunotherapy; eye disease; glaucoma; restenosis;

an integrin binding component, a polycationic nucleic acid-binding component and a lipid component. The integrin binding component comprises an integrin-binding element and a spacer element. Complex of the invention is useful for transfecting cells in vitro or in vivo with a nucleic acid, for treatment or prophylaxis of a condition caused in human or a non-human animal by a defect and/or a deficiency in a gene, immunisation and antisense therapy of a human or a non-human animal. It is useful for transfecting bronchial and lung epithelium and corneal endothelium for gene therapy for cystic fibrosis, asthma and calso various cancers and viral infections. It is also useful as a vaccine or for therapy of neuroblastoma and the effective transfection of primary smooth muscle cells, cardiac myocytes and haematopoietic cells. Heematopoietic cell transfection enables gene therapy, gene vaccination and antisense therapy of diseases involving haematopoietic cells. Heematopoietic cell transfection enables gene therapy, gene vaccination and antisense therapy of diseases involving haematopoietic cells. Iransfection enables gene may be used for adjuvant immunotherapy. Transfection of corneal endothelium is useful for treatment of eye disease affecting the cornea or corneal organ transplants, for example in glaucoma. A gene that prevents proliferation of cells in blood vessel walls is introduced using complex of the invention to reduce restenosis. The present sequence is integrin-binding peptide

cetterosis. The present sequence is integrin-binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   12 AA;

Integrin-immunoglobulin chimeric protein heterodimer complexes as platelet substitutes - contain the alpha and beta integrin chains associated in stable state and bind to extracellular matrix in the presence of plasma components

Claim 41; Page 25; 87pp; Japanese.

This represents a CS-1 peptide sequence. The invention provides

comprise an integrin alpha or beta chain associated with an

comprise an integrin alpha or beta chain associated with an

comprise an integrin alpha or beta chain associated with an

communoglobulin light or heavy chain. These chimeric proteins form

chercodimer complexes, in particular with a chimeric protein containing

an integrin alpha chain and an immunoglobulin chain with a chimeric

comprise in containing an integrin beta chain and an immunoglobulin chain;

complexes the integrin beta chain is preferably alpha 4

company be a light chain. The integrin alpha chain is preferably alpha 4

com alpha 2 and the integrin beta chain is preferably beta 1. Animal cells

companied with vectors containing the DNA coding for the above chimeric

proteins can be used in the preparation of the chimeric proteins and

chair heterodimer complexes. The heterodimer complexes, which are useful

contesting potential promoters and inhibitors of the binding of

themostatics and as diagnostic agents.

active inhibiting cell nucleic acids, Integrin inhibitors including antibodies, proteins, saccharide(s), capable of binding to integrin(s) as ingredient in remedies - for treating hepatitis, by adhesion

Example 3; Page 16; 35pp; Japanese.

The present sequence is used in the course of the invention. The specification describes Hepatitis drugs which contain integrin inhibitors as the active ingredient. These integrin inhibitors include antibodies, proteins, polypeptides, peptides, nucleic acids, saccharides, and their derivatives. They also include low molecular weight compounds capable of binding to integrins (e.g. alpha chain type with alpha 1, particularly anti-VLA-4 antibody, VLA-4 inhibiting peptides and low molecular weight VLA-4 inhibiting compounds. The products can be used

as very late antigen-4 (VLA-4) antagonists to treat diseases mediated by cell adhesion. (I) has antiasthmatic, antiallergic, antinflammatory, neuroprotective and antiarteriosclerotic activities. (I) are used to prevent the action of VLA-4 in prevention and treatment of diseases mediated by cell adhesion selected from asthma, allergic rhinitis, multiple sclerosis, atherosclerosis and inflammatory bowel disease. The present sequence represents a synthetic CS-1 peptide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Very late antigen-4; VLA-4; cell adhesion inhibitor; CD49d/CD29; alpha4/beta7 integrin; cyclic amidine derivative, rhinitis; asthma; multiple sclerosis; atherosclerosis; bowel disease; inflammation; nephritis; AIDS-related dementia; acquired immunodeficiency syndrome; diabetes; conjunctivitis; Alzheimer s disease; aortic stenosis; myeloma; contact dermal hypersensitivit; ulcerative colitis; Crohn's disease; lung disease; cancer; viral infection; meningitis; pulmonary fibrosis;

                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  are cyclised via disulphide or amide bonds. The peptides are very late antigen-4 (VLA-4) adhesion inhibitors. They are useful for treating inflammation, especially allergic inflammation and hepatitis, autoimmune disease, rejection reactions following organ transplants, type I diabetes, Crohn's disease, post-surgical restenosis and arteriosclerosis. The present sequence is used in the course of

This invention relates to the use of a peptide, which is an immunogenic portion derived from a dnaJ heat shock protein (hsp) in modulating an immunome response in a subject. The peptides of the invention may have immunomedulatory, cytostatic, antinflammatory, antibacterial or antiarthritic properties and can stimulate expression of interleukins, tumour necrosis factor and transforming growth factor beta. The immunogenic peptide is useful for modulating (i.e. augmenting/inducing or reducing/inhibiting) an immune response in a subject having an immunological disorder (e.g. autoimmune disease such as arthritis or articular juvenile idiopathic arthritis), an infectious disease, an inflammatory bowel disease or cancer. The immunogenic peptide of the invention is also useful for modulating immunogenic peptide of the invention is also useful for modulating immunogenic peptide of the invention is also useful in methods in mammals, e.g. cat, dog, horse, farm animal (e.g. ovine, bovine or porcine) or human. In general, the peptide is useful in methods involving mucosal colerisation, DNA vaccination, anergy induction or active immunisation. The present sequence represents a human heat shock protein immunogenic peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        treating immunological disorder in subjects such as humans, e.g.
autoimmune disease (e.g. arthritis), infectious disease, inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes novel substituted cyclic amidine derivatives (I) are useful for the prevention or treatment of disease or disorders mediated by cell adhesion in a mammal e.g. asthma, allergic rhinitis, multiple sclerosis, atherosclerosis, inflammatory bowel disease or inflammation e.g. acute respiratory distress syndrome (ARDS), ALDS-related dementia, allergic conjunctivitis, Alzheimer's disease, cortic stenosis, autologous bone marrow transplantation, certain types of toxic and immune based nephritis, contact dermal hypersensitivity, ulcerative colitis, Crohn's disease, inflammatory lung disease, inflammatory sequelae of viral infections, meningitis, multiple myeloma, myocarditis, organ transplantation, psoriaais, pulmonary fibrosis, restenosis, retinitis, rheumatoid arthritis, septic arthritis, stroke, cancer, tumour metastasis, uvelitis, type I diabetes and vascular occlusion following angioplasty. The compound inhibits cell adhesion processes including cell activation, migration, proliferation and differentiation. This sequence represents the CS-I peptide used to study the inhibition of very late antigen-4 (VLA-4, CD49d/CD29 or alpha4/beta7 integrin) dependent adhesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostātic; antinflammatory; antibacterial; antiarthritic; human; autofumune disease; arthritis; articular juvenila idiopathic arthritis; infectious disease; inflammatory bowel disease; cancer; HSJI; mucosal tolerisation; DNA vaccination; anergy induction.

The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are based on laminin or saw-scaled viper echistatin and target integrin, selectin or vinculin. Also included are compounds of formula (Ia) and their multimers (\chi^2)_{-} a +F^1-(\chi^2)_{-} b where,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition comprising integrin or adhesion antagonistic peptide and vehicle, useful for treating or preventing platelet aggregation, has a longer half-life than free peptide
                                                                                                                                                                                                                                                                                         antiinflammatory; immunosuppressive; osteopathic; antagonist; laminin; saw-scaled viper; echistatin; integrin; selectin; vinculin; platelet aggregation; angiogenesis; tumour; inflammation; autoimmune disease; rheumatoid arthritis; osteoporosis.

                                                                                                                                                   One of 1 or 2 of these chains are attached via the N- or C-terminal to a 2,46-trisubstituted s-triazine ring, where one substitution is a polyethylene glycol chain [CH3(OCH2CH2)n-O- (in=1-150)] and the other is either another, same, polyechylene glycol chain, or another, same, peptide chain. These PEG derivates or their salts are useful as animal cell adhesion inhibitors, or as platelet agglutination or adhesion inhibitors. They may also be used as carcinoma metastasis inhibitors, wound healing drugs and immunoregulators.

The compositions are used prophylactically and therapeutically in the same way as (1), e.g. to inhibit platelet aggregation or angiogenesis (tumours), or to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              integrin,
  \Xi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are based on laminin or saw-scaled viper echistatin and target integrin selectin or vinculin. Also included are compounds of formula (Ia) and their multimers (x^2)_a - F^2 - (x^2)_b where;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition comprising integrin or adhesion antagonistic peptide and vehicle, useful for treating or preventing platelet aggregation, has a longer half-life than free peptide
                                                                                 Gaps
                                                                                                                                                                                                                                                    IgG Fc; anticoagulant; thrombolytic; cytostatic; antagonist; antiinflammatory; immunosuppressive; osteopathic; antagonist; laminn; saw-scaled viper; echietatin; inceprin; selectin; vinculin; platelet aggregation; anglogenesis; tumour; inflammation; autoimmune disease; rheumatoid arthritis; osteoporosis.
  the half-life (free
vehicle (especially Fc domain) to (I) increases the half-life (frare normally degraded very quickly in vivo). The present sequence is an antagonist peptide of the invention.
                                                                                 ö

ö
inflammation and autoimmune diseases (e.g. rheumatoid arthritis) and many different forms of osteoporosis, also for diagnosis. Attaching the vehicle (especially Fr domain) to (I) increases the half-life (free (I) are normally degraded very quickly in vivo). The present sequence is an antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are based on laminin or saw-scaled viper echistatin and target integrin, selectin or vinculin.Also included are compounds of formula (Ia) and their miltimers (X'1)_a-F'1-(X'2)_b where,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a-f = 0 or 1, provided at least one of a and b = 1, a nucleic acid that encodes (1a), an expression vector containing the nucleic acid, host cells containing the vector, producing a pharmaceutically active compound (B) by covalently linking at least one Fc domain to at least one amino acid sequence of a selected randomized (I) and any of six laminin-related peptides (Ib). The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ø

used prophylactically and therapeutically in the same way as (I), e.g. to inhibit platelet aggregation or angiogenesis (tumours), or to treat inflammation and autoimmune diseases (e.g. rheumatoid arthritis) and different forms of osteoporosis, also for diagnosis. Attaching the vehicle (sepecially FC domain) to (I) increases the half-life (free (I) are normally degraded very quickly in vivo). The present sequence is an antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The peptide is an example of a cell adhesion polypeptide contg. the amino sequence X-Asp-Y-(A)n-Phe, where X and Y = Ala, Leu, Ile or Val. A= any amino acid and n= 3-10. At least a subsequence of the polypeptide is adherent for MoLT-4 human lymphoblastic leukaemia, A375-SM human metastatic melanoma or H1080 human fibrosarcoma cells. The call adhesion peptides are used to modify or control the adhesion peptides are used to modify or control the conditions such as rheumatoid arthritis, asthma, sepsis, graft rejection, inflammatory bowel disease, reperfusion of cardiac tissue after myocardial infarction, and coagulatory disorders. They are selective antagonists of cell adhesion, e.g. they promote adhesion of the speccified cells but inhibit adhesion to the natural adhesion
                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                            6..8

                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptide is an example of a cell adhesion polypeptide contg. the amino sequence X-Asp-Y-(A)n-Phe, where X and Y = Ala, Leu, Ile or Val, A = any amino acid and n= 3-10. At least a subsequence of the polypeptide is adherent for MOLT-4 human lymphoblastic leukaemia, A375-SM human metastatic melanoma or H1080 human fibrosarcoma cells. The cell adhesion peptides are used to modify or control the adhesive properties of cells, e.g. in treatment of inflammatory conditions such as rheumatoid arthritis, asthma, sepsis, graft rejection, inflammatory bowel disease, reperfusion of cardiac tissue after myocardial infarction, and coagulatory disorders. They are selective antagonists of cell adhesion, e.g. they promote adhesion of the speccified cells but inhibit adhesion to the natural adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa

The present sequence represents an alpha4 integrins targeting sequence, which is used in an example from the present invention. The present invention describes a chimeric adenovirus fibre protein (AFP) containing a constrained non-native amino acid sequence. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene therapy, for treating cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. cystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, tuberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                          Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic, conjugated polypeptide; herpes simplex virus; HSV; ICP4; immunomodulatory; T cell, immunogen; vaccine; ICP27; glycoprotein B; ribonucleotide reductase; ICP34, 5; glycoprotein B; glycoprotein F; immune response; genetic immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric adenovirus fibre proteins - containing non-native amino acid sequence to provide for binding and entry into cells, especially for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 23; DB 19; Length 21; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed non-native amino acid sequence from a chimeric adenovirus fibre protein (AFP) of the present invention. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene therapy. For trearing cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. cystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, truberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autolimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                 Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The invention provides immunogenic conjugated polypeptides which comprise a herpes simplex virus peptide (HSV) linked to an immunomodulatory peptide and which promote binding to T cells. The novel immunogenic conjugated polypeptides are effective as an immunogen in a vaccine for treatment or prevention of infection by HSV and are represented by the formula Pl-x-P2 or P2-x-P1; where Pl = a HSV specific antigenic peptide form a protein of HSV type lo or type 2, selected from ICP27, glycoprotein E, ribonucleotide reductase, ICP4, ICP34-S, glycoprotein E and immunomodulatory peptide which is a portion of an immunoprotein P; P2 = an immunomodulatory peptide which is a portion of an immunoprotein bond or a class of subclass of T cells and which directs a predominantly TH1 type, immune response to the peptide CP1; and x = a covalent bond or a clasvable or non-clasvable peptide CP1; and x = a covalent bond or a clasvable or non-clasvable peptide CP1; and x = a covalent bond or a clasvable or non-clasvable peptide CP1; and x = a covalent bond or a clasvable or non-clasvable peptide CP1; and x = a covalent bond or a clasvable or non-clasvable peptide CP1; and x = a covalent bond filling HSV infected cells. They can be used for the treatment or prevention of HSV infection. In addition, DNA encoding the polypeptide and detecting a reaction between the T cells and the colls and the polypeptide. CP1 polypeptide or latent, in an cindividual by HSV by mixing T cells from the individual with the polypeptide.
                                                                                                                                                                                                                                                                                                                                                   New immunogenic conjugated polypeptides

Sequence 6, Application US/10086217

Sequence 6, Application US/10086217

Patent No. US2002015998A1

GENERAL INFORMATION:

APPLICANT: WUNDY, GREGORY R.

APPLICANT: WONEDA, TOSHIYUKI

TITLE OF INVENTION: METHODS OF TREATING MULTIPLE MYELOMA AND

TITLE OF INVENTION: MYELOMA-INDUCED BONE RESORPTION USING INTEGRIN

TITLE OF INVENTION: MYELOMA-INDUCED BONE RESORPTION USING INTEGRIN

TITLE OF INVENTION: MYELOMA-INDUCED BONE RESORPTION USING INTEGRIN

TITLE OF INVENTION: MYBER: US/10/086,217

CURRENT PILING DATE: 2001-08-31

PRIOR PILING DATE: 2001-08-31

PRIOR PILING DATE: 1998-09-13

PRIOR PILING DATE: 1998-09-14

NUMBER OF SEQ ID NOS: 8

SOFTWARE PATENTION VOLUBER: 60/100,182

PRIOR FILING DATE: 1998-09-14

NUMBER OF SEQ ID NOS: 8

SOFTWARE PATENTING DATE: 1998-09-14

NUMBER OF SEQ ID NOS: 8

MEDIUM TYPE: Floppy disk

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION NUMBER: US/08/910,386A

FILING DATE: 13-AUG-1997

CLASSIFICATION NUMBER: US/08/910,386A

FILING DATE: 13-AUG-1997

ATTORNEY/AGBNT INFORMATION:

NAMME: Bastian, Kevin L.

REGISTRATION NUMBER: 03.070-058950US

TELEPHONE: (415) 576-0300

INFORMATION FOR SEQ ID NO: 9:

SEQUENCE CHARACTERISTICS:

LENGTH: 813 amino acids

TYPE: amino acid

TOPOLOGY: Inear

MOLECULE TYPE: protein
